FINAL RELEASE

Christian Bachl, Haris Jusic, David Cvetkovic

Inhalt

0.1 Feature List

1. Login

- When the login button is clicked. The server checks the email and compare the password-hash
- If the login input passed the validation, the user gets linked to the protected pages.
- Printing out error message when the validation failed

2. Register

- Validation of a User – A user is Valid, if the email is unique. That's means the server checks if a user with the email-input already exists. If not, it is a new user. After this process the server continue checking if all the require input fields are set and sends a status 200 to the client(front-end) if all is OK.
- After checking the validation, the server saves the user into the database.

3. Main Interface

- Switching between the tab pages. Nicely done with the Ionic-Components.

4. Event page

- Having the ability to create or join an event by clicking on the "+" – sign.
- After making an event you get to another page. In this you can set settings such as declaring the event name, setting the date, making a description and setting a max participant number. Then you can create the event.
- Afterwards you get back to your "event-list".
- Now you can click on any event and get to another page – "event-view".
- In this you can make changes or look up for information.
- You can see the event-information or who or how many participants each event has.
- You can invite people as well in the event-view.
- Changes on the event-settings can also be made.

5. Home page

- Logout Button
- Some description about the application

6. Settings page

- The UI is getting displayed on the setting page.
- An user has the ability to make some changes about his profile, such as profile picture, name, birth etc.

7. Notification

- A notification signal is being displayed on this "Notifications" – tab.
- After clicking on it, the user gets to see all the invitations he gets.
- He can decide whether he wants to accept or reject the invitation.
